Q4. Two Sum

Approach: T.C. O(N), S.C. O(N)

→ Create a HashMap which stores the number as key and it’s array index as value

→ Iterate the array, and for each number, check whether it’s pair exists in the HashMap or not

→If yes, then fill the answer array according to the indexes fetched from the map and break the loop

→ If not, put the current number and it’s index into the map
